1. Abstract

This project uses Tableau to explore global petrol, diesel, and LPG prices alongside tax percentage, subsidy level, country income level, and Brent crude oil trends. It provides visual comparisons for energy policy, supply-chain, and energy economics use cases.

2. Problem Statement

Fuel prices vary across countries and regions. Stakeholders need a clear way to compare fuel prices and explore how these differences coexist with taxes, subsidies, income groups, and crude-oil movements. The dashboard summarizes patterns; it does not prove that any factor causes a particular price.

3. Objectives

• Compare average petrol, diesel, and LPG prices across countries.
• Explore tax percentage by country and income level.
• Compare petrol prices by subsidy level.
• View Brent crude oil prices over time.
• Combine relevant charts in one dashboard.

4. Dataset Overview

The supplied CSV was identified as containing 27,468 rows and 10 columns: date, country, region, income_level, subsidy_level, petrol_usd_liter, diesel_usd_liter, lpg_usd_liter, brent_crude_usd, and tax_percentage. Verify field types and units in Tableau before final submission.

5. Methodology

1. Connect the CSV file to Tableau Public Desktop.
2. Check date and numeric field types.
3. Create country-level fuel price charts and tax/subsidy/income comparisons.

4. Build the dashboard and format titles and labels.
5. Publish to Tableau Public and save the local .twb workbook.
6. Verify chart titles, readability, and duplicate views.

6. Dashboard Visualizations

No.	Visualization	Question it helps explore
1	Average petrol price by country	Which countries have higher/lower average petrol prices?
2	Average diesel price by country	How do diesel prices differ by country?
3	Average LPG price by country	How do LPG prices compare by country?
4	Average tax percentage by country	How does tax percentage vary by country?
5	Brent crude price by year	What trend is visible over time?
6	Petrol, diesel, and LPG comparison by country	How do the three fuels compare in a market?
7	Average tax percentage by income level	How do tax averages vary by income group?
8	Average petrol price by subsidy level	How do petrol averages vary across subsidy levels?
9	Confirm actual ninth visualization	Use a distinct chart answering a separate question; avoid duplicating chart 5.

Important: The previously recorded worksheet list included a repeated Brent crude line chart. Confirm the actual dashboard has nine distinct visualizations and replace any duplicate before final submission.

7. Scenario Mapping

Energy Policy Consultant: Fuel price, tax, and subsidy comparisons help identify patterns relevant to affordability and policy discussion.

Global Supply Chain Manager: Comparing diesel and other fuel prices across markets can provide context for operating costs; crude-oil trends add broader market context.

Energy Economics Researcher: Income-group comparisons and time trends support descriptive analysis and further research questions.

8. Findings and Interpretation

Use the actual dashboard values to describe findings. Do not invent country rankings or claim that tax/subsidy causes a price change without further evidence.

9. Limitations

• The dashboard reflects only the supplied dataset and its coverage.
• Averages can hide variation within countries and over time.
• Observed relationships do not establish causation.

10. Project Demonstration

The demo video is available here: Open the project demonstration video. The recording should show the Tableau dashboard and explain the visualizations and three project scenarios.
