IDEATION PHASE

Define Problem Statements

Student: Sheetal   Project: Global Fuel Prices and Taxation Trends Dashboard

Background

Fuel prices vary across countries due to market conditions, taxation, subsidies, and broader crude-oil movements. Stakeholders need a clear way to explore these differences using the provided dataset.

Problem statement

Build an interactive Tableau dashboard that summarizes global petrol, diesel, and LPG prices and explores how tax percentage, subsidy level, income level, and Brent crude prices vary across countries and time.

Scenario 1 — Energy Policy Consultant

• Which countries have relatively high or low fuel prices?

• How do tax percentages vary across countries?

• How might subsidy levels relate to petrol prices?

Scenario 2 — Global Supply Chain Manager

• Where are fuel-cost differences that may affect transport and operating costs?

• How do petrol, diesel, and LPG prices compare across markets?

• What crude-oil trend should be considered when interpreting fuel costs?

Scenario 3 — Energy Economics Researcher

• How do fuel prices and tax levels differ by income group?

• How have Brent crude prices changed over time?

• What patterns are visible in the dataset, without assuming causation?

Scope and limitations

The dashboard describes patterns in the supplied dataset. Associations do not prove causation, and conclusions should be interpreted in light of data coverage, missing values, and aggregation choices.

Submission note: These are filled content drafts prepared from the project details available. Check them against the official SkillWallet template fields and add any required official Team ID or institution-specific information before submission.
