PROJECT DESIGN PHASE

Dashboard Layout and Visualization Design

Student: Sheetal   Project: Global Fuel Prices and Taxation Trends Dashboard

Design approach

Use a dashboard with a descriptive title and a balanced layout. Place overall fuel-price comparisons first, followed by tax/subsidy/income analysis and the crude-oil trend.

Visualization plan

• Horizontal bar chart: average petrol price by country.

• Horizontal bar chart: average diesel price by country.

• Horizontal bar chart: average LPG price by country.

• Bar chart: average tax percentage by country.

• Line chart: average Brent crude price by year.

• Grouped comparison: petrol, diesel, and LPG averages by country.

• Bar chart: average tax percentage by income level.

• Bar chart: average petrol price by subsidy level.

• Use a distinct ninth chart only if it answers a separate question; avoid duplicating the Brent crude line chart.

Visual design rules

• Use descriptive titles and readable labels.

• Keep the same currency/unit conventions across related charts.

• Sort bars where it improves comparison.

• Avoid overcrowding country labels; use filters or a smaller set if needed.

• Clearly state that averages summarize the selected dataset.

Data model

Use the CSV as the data source. Confirm Date is recognized as a date and the numeric measures are numeric. Use AVG for price measures when the goal is average comparison.

Submission note: These are filled content drafts prepared from the project details available. Check them against the official SkillWallet template fields and add any required official Team ID or institution-specific information before submission.
