PROJECT DEMONSTRATION PHASE

Suggested 3-minute narration script

Student: Sheetal   Project: Global Fuel Prices and Taxation Trends Dashboard

0:00–0:20 — Introduction

Hello, my name is Sheetal. My project is Global Fuel Prices and Taxation Trends Dashboard, created using Tableau. It explores fuel prices and related economic indicators across countries.

0:20–0:45 — Problem and dataset

The dataset includes date, country, region, income level, subsidy level, petrol price, diesel price, LPG price, Brent crude price, and tax percentage. The aim is to make these measures easier to compare visually.

0:45–1:25 — Fuel-price comparisons

The first charts compare average petrol, diesel, and LPG prices by country. These help viewers identify differences between markets and consider possible implications for fuel affordability and operating costs.

1:25–1:55 — Tax, income, and subsidy

The tax chart compares tax percentages, while the income-level chart groups tax patterns by country income category. The subsidy chart compares petrol prices across subsidy levels. These charts show patterns, not proof that one factor causes another.

1:55–2:20 — Crude-oil trend

The line chart shows Brent crude prices over time. This provides broader market context when reviewing retail fuel prices.

2:20–2:45 — Scenarios

For energy policy consultants, the dashboard supports tax and subsidy comparisons. For supply-chain managers, it helps compare fuel costs across markets. For researchers, it supports exploration of income-group and time trends.

2:45–3:00 — Conclusion

In conclusion, the dashboard combines multiple fuel indicators in one place. Thank you for watching.

Submission note: These are filled content drafts prepared from the project details available. Check them against the official SkillWallet template fields and add any required official Team ID or institution-specific information before submission.
